

# ENTOMOLOGY (AICRP on Sugarcane), MANDYA CENTRE

## Experiment – E.4.1

### 1. Title of the Experiment: Evaluation of Zonal Entries / Genotypes for their reaction against Major Insect pests.

2. Objectives: To grade the entries in the Zonal varietal trials for their behavior towards damage by key pests in the area.

3. Experimental details:

a. Location: ZARS, Mandy a      b. Situation: Irrigated

Forty six genotypes, comprising eight each under IVT Early and IVT Midlate, seven under AVT-E I-Plant, eight under AVT Midlate I –Plant, seven under AVT Early II Plant and eight under AVT Midlate II- plant with their respective group standards were evaluated against early shoot borer, top shoot borer and internode borer at Mandy a .

### Reaction of sugarcane genotypes against major insect pests of sugarcane at Mandy a

INB	All the entries showed LS reaction to INB					

**Experiment –E.27 Mass multiplication of potential bio-agents of sugarcane insect pest**

1. Title of the Experiment: Mass multiplication of potential bio agents of Sugarcane white wooly aphid *Ceratovaccuna lanigera*
2. Objectives: To develop effective management of *Ceratovaccuna lanigera*
3. Experimental details: Mass multiplication technique for brown lace wing *Micromus igoratus* have been standardized under laboratory condition
4. Results Experiment vitiated because of non availability of white wooly aphid *Ceratovaccuna lanigera* the host of *Micromus igoratus*.

**Experiment- E.28**

1. **Title of the Experiment: Survey and Surveillance of Sugarcane insect pests**
2. Objectives: To identify the key insect-pests in the area
3. Experimental details:
  - a. Location: Mandya district
  - b. Situation: Irrigated
- c. Methodology: Survey was conducted once in a month in different sugar factory areas of Mandya districts and the findings were presented briefly in the table given below

4. Results:

**Survey and Surveillance of Sugarcane insect pests in Mandya district**

<b>Sl. No.</b>	<b>PEST</b>	<b>LEVEL OF INCIDENCE (%)</b>
1	Early Shoot Borer	9.25-47.50
2	Top Shoot Borer	3.50-23.00
3	Internode Borer	8.25-43.25
4	Pyrilla	<0.25 adult/ nymph/clump
5	Woolly aphid	Incidence restricted to few clumps
6	Mealy bug	25% of the clumps observed over an area of 15 acres at Chikkabagilu (Malvalli Taluk)
7	Root Grub	Two Instances (<1 gunta area affected )

**Experiment –E.30**

1. **Title of the Experiment: Monitoring of insect-pests and Bio-agents in sugarcane agro ecosystem**
2. Objectives: To find out the activity of sugarcane pests and their bio-agents
3. Experimental details:
 

a. Location: ZARS, Mandya	b. Situation: Irrigated
c. Plot Size: 0.5 ac	d. Fertilizer (kg/ha) 25:100:125 NPK
e. Variety: Co 86032	
4. Date of planting: 25/01/2011
5. Methodology: Sugarcane was raised in 0.5 acre area. All the recommended practices were followed except, application of insecticides. Observations on the incidence of borers was recorded by examining 100 shoots/canes at 5 places (Four corners and in the middle), Sucking pests were evaluated by examining 20 canes.

6. Results:

**Monitoring of insect-pests and Bio-agents in sugarcane agro eco system**

Time of Observation	ESB	TSB	INB
30 DAP	2.24	-	-
60 DAP	6.75	-	-
90 DAP	10.50	-	-
120 DAP	3.80	-	-
150 DAP	-	3.75	-
210 DAP	-	12.50	-
At Harvest	-	-	16.50
Cumulative incidence	23.29	16.25	16.50

**Experiment – E.32**

1. Title of the Experiment: Study Population dynamics of sugarcane borers using pheromone traps
2. Objectives: To study the population dynamics of sugarcane borers (Early Shoot Borer, Top Shoot Borer and Inter Shoot Borer)
3. Experimental details:
 

a. Location: ZARS, Mandya	b. Situation: Irrigated
c. Plot Size: 1.0 ac	d. Fertilizer (kg/ha) 25:100:125 NPK
e. Variety: Co 62175	
4. Date of planting: 25/01/2011
5. Methodology: Three pheromone traps for each sugarcane borer pest were installed in the second fortnight of February till the harvest of the crop in one acre area. The pheromone lures were changed once in two months. Observations were made at weekly interval.
6. Results: ESB and TSB moths were active through out the year. Characteristic peak of ESB was recorded on 19<sup>th</sup> standard week (May 2<sup>nd</sup> week). Top shoot borer activity was high and it formed peaks in March, April, August and September. Internode borer activity was low through out the year.

**Population dynamics of Sugarcane borers through Pheromone Traps 2011**

Correlation study of weather parameters with pheromone trap catches of Sugarcane borers :

Sugarcane borers	Temperature °C		Relative humidity (%)		Rainfall (mm)
	Maximum	Minimum	RH- I hour	RH- II Hour	
ESB	0.24	0.30	0.12	-0.22	-0.15
TSB	-0.27	0.19	0.21	0.47	0.02
INB	-0.11	0.11	0.06	0.18	-0.09

Early shoot borer established positive correlation with maximum temperature and negative correlation with rainfall and relative humidity at 14.30hr. Top shoot borer catches established negative correlation with maximum temperature and positive correlation with relative humidity at 14.30hr. Internode borer catches established negative correlation with both maximum temperature and rainfall.
